

Green Finance and Green Jobs

Will Blyth
Oxford Energy Associates

1st April, 2014, UK Energy System in Transition: Technology, Infrastructure and Investment
Edinburgh Centre for Carbon Innovation

Green Finance

- What is the size of the ‘investment gap’?
- Low-cost sources of finance, and prospects for scaling these up
- New sources of finance
- Policy options

Based on:

“Financing the UK Power Sector: Is the Money Available?”

W. Blyth, R. McCarthy, R. Gross

Working Paper, UKERC Uncertainties Project.

UKERC

'Investment Gap' Annual Build Rate MW

Annual UK CAPEX £m

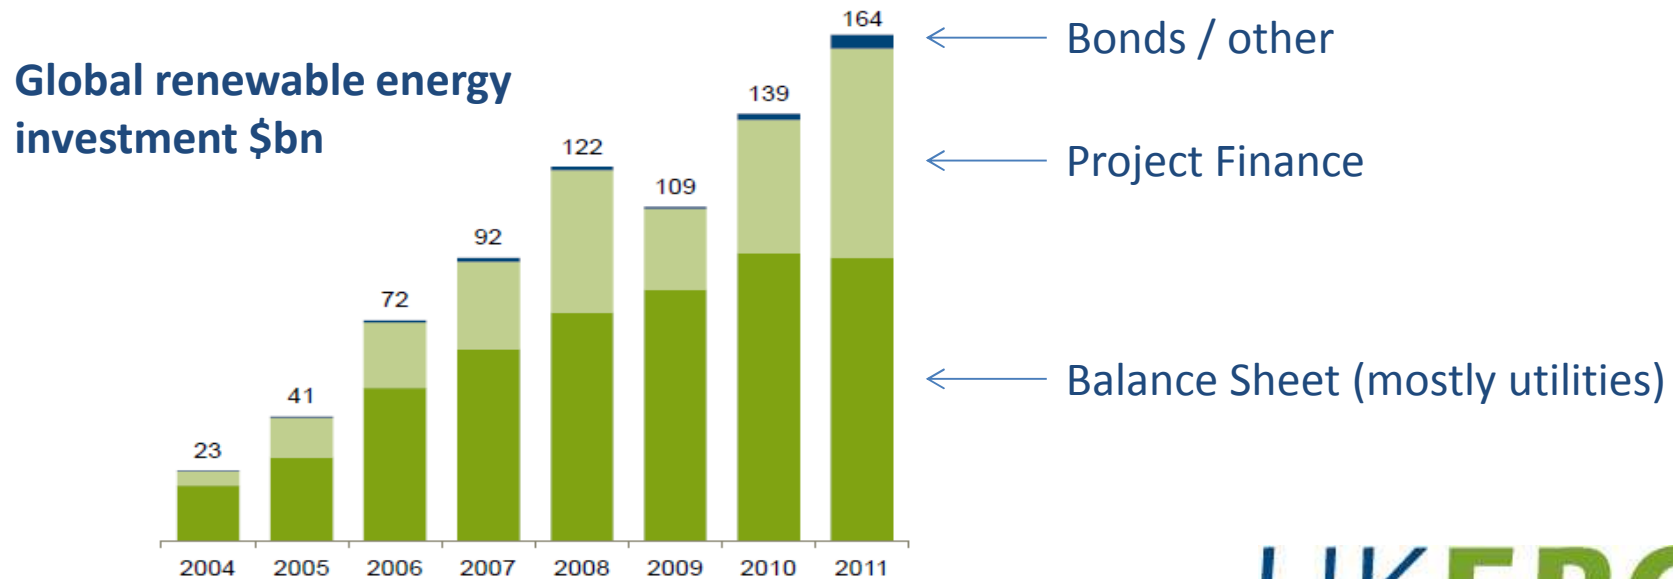

Low-cost finance: Two Major Investment Routes

- **Utilities:**

85% of the 16.5 GW of new capacity 2006–2012 in UK, has been built by the major utility companies (BNEF, 2012)

- **Financing of renewables:**

Green Finance Conclusions

- History shows that finance can flow if investment conditions are right – puts the emphasis back on policy
- But large volumes of money (institutional investors) only available for relatively low-risk investments
- Current health of the utilities and business case for investment is therefore a worry
- Alternative routes for institutional finance to go directly into projects are being developed
- Back-of-the-envelope calculations suggest up to £1bn for UK renewables via this route??

Potential Solutions

- Overhaul the utility model
 - Allow them to make a profit
 - Dedicated wind utility
 - Re-regulate generation sector
- Ramp up project financing by accelerating the re-financing of projects
- Increased role of public finance institutions:
 - Guarantees
 - Public finance initiatives
 - GIB / EIB co-investment
 - Green bonds

Green Jobs

- What are green jobs, and how can we measure them?
- Macroeconomic perspectives and concepts
- Comparative analysis of job estimates from the literature
- Conclusions

Based on systematic review of literature:

“Low carbon jobs: the evidence for net job creation from policy support for energy efficiency and renewable energy”

Draft TPA report

UKERC

What are green jobs?

■ Job types

- Direct, indirect, induced
- Short vs. long-term
- Manufacturing, construction & installation, O&M
- Supply chain / wider economy

■ Net vs. gross jobs (accounting boundary)

- Equipment manf inside boundary?
- Displaced jobs in product markets
- Impacts on labour market
- Impacts on household expenditure

UKERC

Calculating net jobs

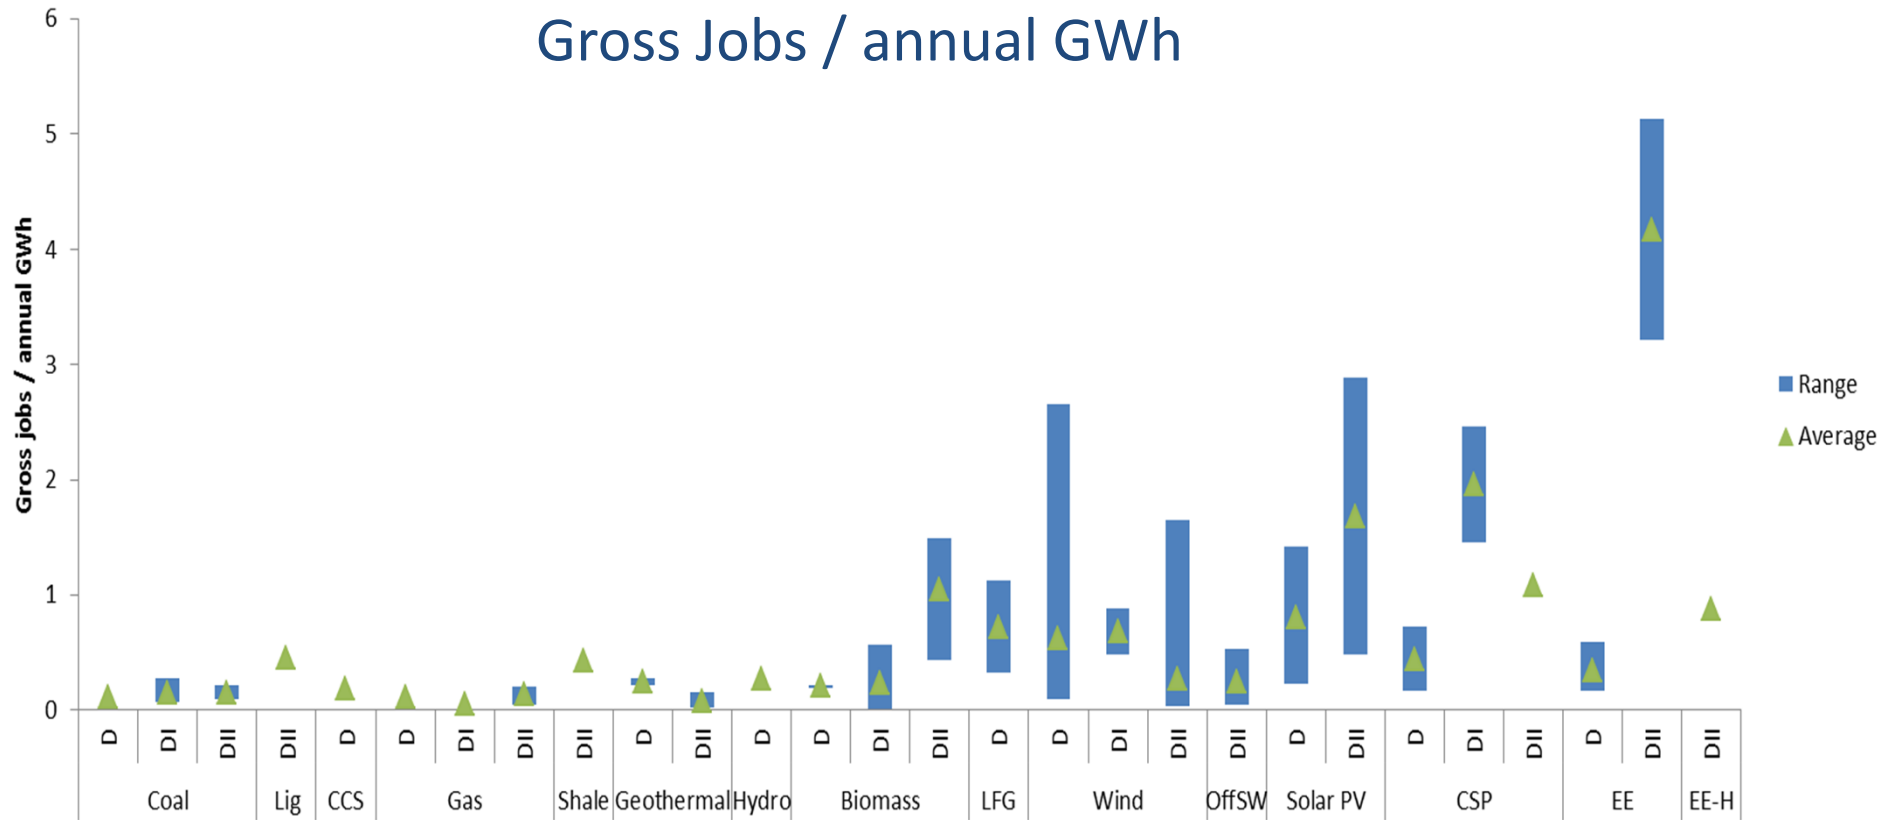

Mostly Input-Output analysis, some direct job surveys, some CGE / other approaches

Macro-economic perspectives

- Is the economy in equilibrium?
- Is there an output (aggregate demand) gap?
- Role of fiscal and monetary stimulus
- Multipliers, interest rates and crowding out
- Business cycles, long-term growth and technology development

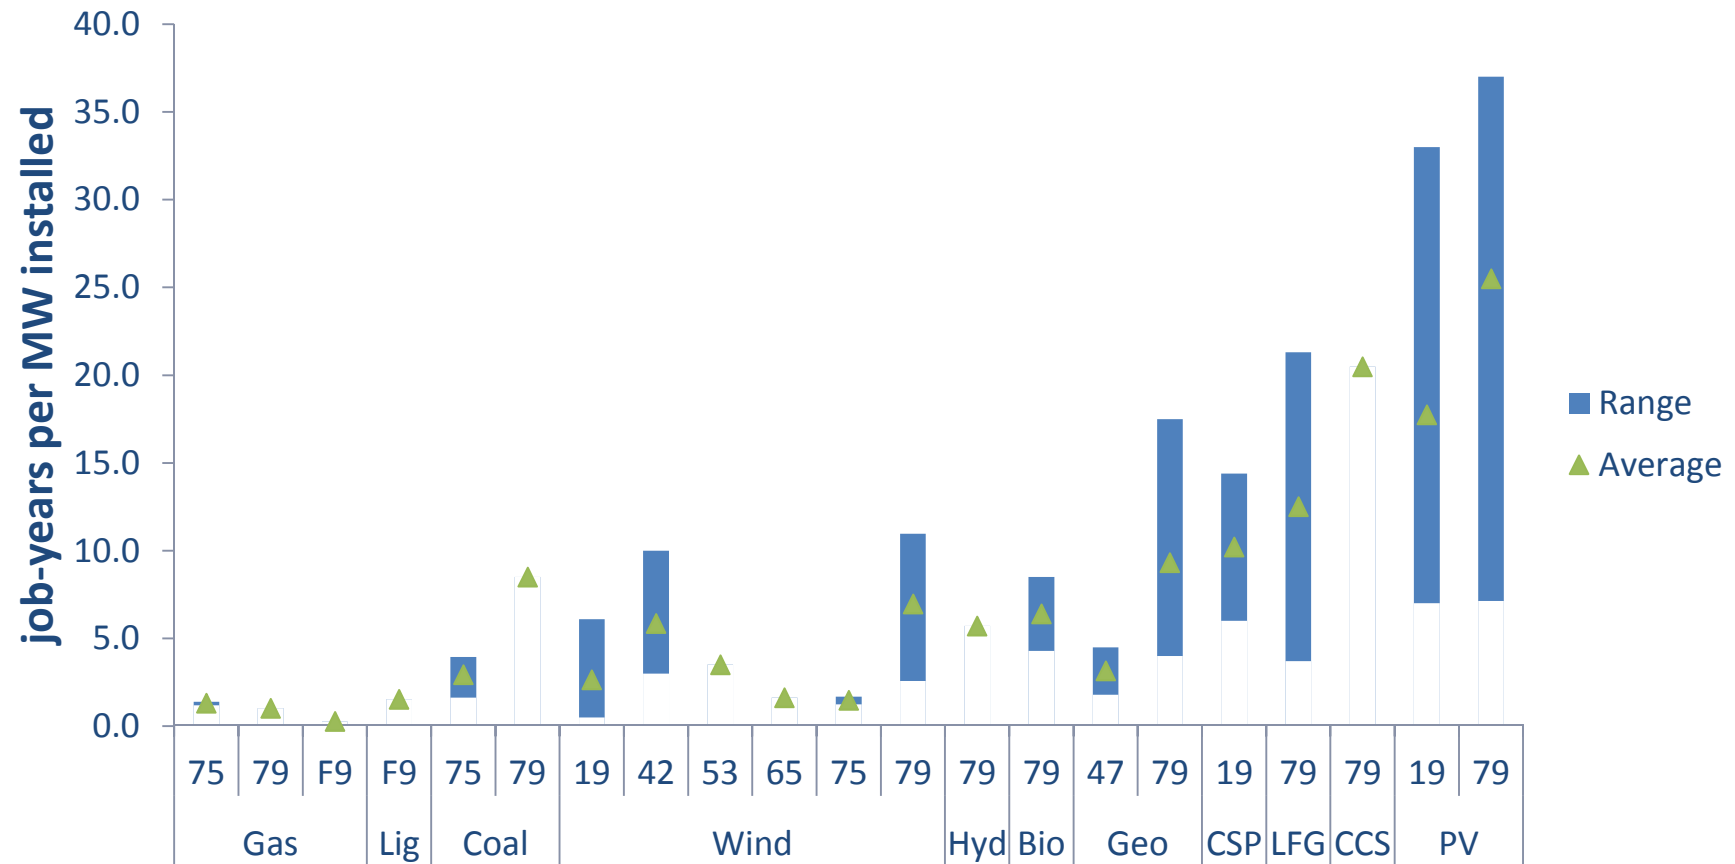

Evidence on Gross Jobs

Evidence on Net Jobs

Short-Term Jobs (M,C&I) Comparing Fossil vs. Renewables

Green Jobs Conclusions

- On a simple ‘per MWh’ or ‘per £invested’ basis, renewables appear more labour intensive than fossil fuels. BUT:
 - The energy sector is not a major direct employer, so the effects we see are relatively small
 - The ability to create jobs (in any sector) depends on having spare capacity in the economy (i.e. recession). Timescales are important in determining the effects of policy.
 - Taking account of price effects will reduce employment benefits if higher costs lead to reduced household spending. The source of the money is important – is stimulus money really additional?
- Do jobs lead or follow the economy?
 - In the long-term (beyond the current business cycle), labour-intensity may not in itself be a good thing. Dynamic efficiency should drive decisions – i.e. will more RE/EE in the system make the economy more efficient in the long-run?
